Regalis® Plus plant growth regulator

The simplest way to improve your orchards’ light penetration and crop quality.

Regalis Plus is a uniquely targeted growth regulator that reduces shoot growth in apples and cherries to simplify crop management, increase yields, and produce great-looking fruit. A more open canopy also makes it easier to achieve good spray coverage and maximise the value of crop protection products.

- More intense fruit colour as a result of better light penetration through a more open canopy.
- An optimal balance between shoot growth, fruit setting and yield.
- Significantly lower pruning time and labour costs.
- Increased yields of higher quality fruit through reduced fruit drop and bitter pit.
- More uniform fruit and prolific fruit bearing in following years with more light to stimulate dormant buds.
- Full built-in adjuvant package improves ease of use and reliability.

Crops
Apples and cherries

Application method
Ground application only

Harvest WHPs
Apples: 8 weeks
Cherries: 4 weeks
Grazing: 8 weeks
How and when to apply Regalis Plus

**Rates**

<tr>
<td>Apples</td>
<td>50–75 g/100 L</td>
</tr>
<tr>
<td>Cherries</td>
<td>100 g/100 L</td>
</tr>
</tbody>
</table>

**Method**

Apply by ground application equipment only. Use commercial orchard equipment set to deliver a high spray volume with a medium to coarse droplet range.

The performance of Regalis Plus is maximised when the spray solution pH drops below 5. The inbuilt acidifying agents have been added to ensure this occurs.

When applying it is important to target the right growth stage and ensure good even coverage throughout the tree canopy to target all the growth shoots.

**Timing**

**Apples**

Apply in a two or three spray program starting when terminal shoots are 3–5 cm long. Repeat applications at 3 to 5-weekly intervals.

Use the higher rate on large, vigorous trees.

Apply a third spray if required on vigorous trees.

**Cherries**

Apply in a program of two sprays 3 to 4 weeks apart starting when terminal shoots are 5 cm long.

**Apples Spray Timing**

---

**Reduced apple shoot growth**

Maximum 3 applications of 75 g/100 L per season in apples

**Reduced apple shoot growth**

- Application 1: Blooming period (BBCH 60–68)
- Application 2: Late flowering to early fruit development (BBCH 69–73)
- Application 3: Fruit development (BBCH 73–79)
