**FACT SHEET**

**Merivon® fungicide in macadamia nuts**

**Double-active husk spot control**

Merivon® can raise the previous industry standard for protection against husk spot to a new level with the addition of new chemistry. Merivon combines an innovative Group 7 fungicide with the proven pyraclostrobin chemistry of Cabrio® to improve and extend disease control. Adding Merivon to the orchard’s spray program can both provide a better result each season and help manage resistance to give the older products in the rotation a longer future.

- A combination of powerful innovation and proven efficacy.
- A new active ingredient in macadamias.
- Significantly reduced nut drop, resulting in higher marketable yields.
- Application flexibility and a low residue profile.
- Rapid uptake and excellent rainfastness.
- An ‘X factor’ that maximises crop quality and appeal.

**Disease controlled**

Husk spot

**Application methods**

Dilute or concentrate ground spraying
How and when to use Merivon in macadamias

Rate
The rate of application will be determined when registration is approved by the APVMA.

Methods
High volume spray to the point of run-off or concentrate spray with equivalent rate per hectare. Thorough coverage of the crop is essential for best results.
Except when applying with orchard airblast equipment, DO NOT apply with spray droplets smaller than MEDIUM.

Timings
Apply Merivon for the first time at the match head growth stage with a repeat application 21 days later.
Do not apply Merivon more than 3 times each season, with no more than 2 consecutive applications.

Resistance management
Merivon contains two active ingredients and belongs to two mode-of-action groups: Group 7, the SDHIs (Succinate Dehydrogenase inhibitors), and Group 11, the QoIs (Quinone outside Inhibitors).
To help manage resistance pressure, ensure that fungicides from an alternative chemical group are also included in the spray program each season.
